

Severity 1 Incident Escalation SOP

Department/Category: Operations

Synthetic demonstration document for the Infosys GPT project. This material is fictional and should not be treated as an official Infosys policy, guide, manual, sales asset, or SOP.

Purpose

This synthetic standard operating procedure describes a fictional Severity 1 incident escalation workflow for demonstration purposes. It is not an official company SOP.

Severity 1

A Severity 1 incident is a critical service disruption with significant business impact requiring immediate coordinated response.

Initial Response

The on-call responder should acknowledge the incident, create or update the incident record, begin impact assessment, and notify the incident coordination function.

Escalation

If the incident remains unresolved or requires additional expertise, the responder should escalate to the appropriate technical and service owners using the approved escalation path.

Communication

Incident updates should state the known impact, current status, actions in progress, and next expected update. Updates should avoid unsupported assumptions.

Closure

An incident should be closed after service recovery is confirmed and required closure information is recorded. A post-incident review should capture root cause, contributing factors, and follow-up actions where required.
